

Frequently Asked Questions

HOW TO USE A ROUTER AS A SWITCH / ACCESSPOINT

1. Please choose DHCP as “disable”.
2. Assign a fixed IP address to the router, e.g. if your gateway in the network has an IP address 192.168.2.1, then please give your router address 192.168.2.10 or any other IP address in the range of 192.168.2.xx, as long as this IP address has not been used by other devices in the network. Write down this IP address.
3. Configure wireless settings for the router.
4. Connect one LAN port of the router to the LAN port of your other router/switch. Connect your PCs to the rest of the LAN ports of the router.
5. Use your laptop/PC's wireless LAN card to detect the wireless network from the router and then try to do wireless connection, ----- that is all.
